

Windows Server System Family Integration

Using our E-Business Developer Suite, we deliver integrated e-business solutions built upon the Microsoft Windows Server System family.

Microsoft's Windows Server System family provides a platform upon which to build solutions to specific business problems. Cubik consultants can work with you to understand each business problem and architect the most appropriate technology solution to address it.

In some instances, use of the Cubik E-Business Developer Suite provides a basis for accelerating the project lifecycle and delivering solutions even more quickly than would be possible using a wholly bespoke approach.

The core components around which Cubik offers its consultancy and development services are:

Windows Server 2003

Windows Server 2003 is the preferred operating system for secure web-enabled applications and solutions. Windows Server combines powerful tools and technologies with ease of management, making it the ideal operating system platform for any web solution.

Windows Sharepoint Services

Windows SharePoint Services, a component of Windows Server 2003, makes it easy to quickly create collaborative web sites that provide rich, powerful tools and access to data. Windows SharePoint Services include close integration to the Microsoft Office suite of productivity applications and with SharePoint Portal Server.

SQL Server 2000

SQL Server 2000 is a complete, web-enabled database package. SQL Server provides reliable, scalable, high-performance data storage for Microsoft integrated e-business technologies.

ASP .NET and the .NET Framework

Microsoft integrated e-business technologies are built on the .NET Framework. The .NET framework provides a secure, extensible development platform for portal solutions, along with the infrastructure to support efficient and effective development efforts and integration with industry standards such as SOAP and XML.

Microsoft Sharepoint Portal Server 2003

Microsoft SharePoint Portal Server (SPS) 2003 is a scalable, reliable, high performance portal server with the ability to tie together content, people, and applications. SPS provides a wide range of key portal capabilities, including single sign on, application integration, personalisation, and content targeting. SPS supports flexible deployment scenarios and includes simple, centralised management tools, making it applicable to a wide range of portal needs.

Microsoft Content Management Server 2002

Microsoft Content Management Server (MCMS) 2002 enables you to quickly build and deploy content-driven websites. MCMS empowers content owners and creators to manage their own content, and provides a rich, personalised experience to end users.

Microsoft Commerce Server 2002

Microsoft Commerce Server (CS) 2002 makes it easier to build powerful personalised portal solutions by providing an application framework, including transactional ecommerce capabilities, catalogue management, merchandising, user profiling, and analytics.

Microsoft BizTalk Server

Microsoft BizTalk Server (BTS) makes it easy to build and deploy integrated business processes. BizTalk Server includes BizTalk Adapters that provide integration with a wide variety of third-party applications.
